

AJIO E-Commerce Testing Planner

Fields	Details
Project Type	E-Commerce website functional testing capstone
Selected Website	AJIO
Website URL	https://www.ajio.com/
Automation stack	Playwright with JavaScript
Minimum requirement	8 services/modules, 15 test cases per service, total 120 test cases
Testing focus	Form validation, Front-end user flows, cart, checkout behavior, profile/account related pages and reporting evidence

Project Overview

This capstone project focuses on testing the Ajio e-commerce website from the point of view of a QA engineer at an enterprise level. The capstone is designed as a QA exercise for the AJIO storefront, with the emphasis placed on observing user-facing behavior rather than building or changing the application itself. The goal is to study the shopping experience, map the core customer journeys, write structured test cases, automate a useful subset in Playwright, and package the results in a submission-ready format

Because AJIO is centered on fashion and lifestyle shopping, the plan gives special attention to catalog browsing, brand discovery, filters for size and color, coupon and offer handling, cart behavior, checkout steps, and account utilities such as order tracking and saved lists. Since all the required features in an e-commerce website are present in this case, this site is suitable and is chosen for this capstone project that requires at least 120 total test cases.

Why AJIO works well for this capstone

- It is a public e-commerce application and can be accessed without building a website locally
- It offers enough distinct journeys to divide the work into eight meaningful services.
- Its fashion-oriented layout supports realistic coverage such as brand search, size selection, wishlists, and offer banners.
- Playwright with JavaScript fits naturally for browser-based functional automation and evidence capture.
- Dummy data can be used throughout, which keeps the project safe, repeatable, and easy to reset.

Project objectives

- Write a complete service-wise test plan for the selected storefront.
- Prepare at least 120 test cases across eight modules.
- Cover positive flows, negative paths, form validation, navigation checks, and simple regression scenarios.
- Automate the chosen flows using Playwright with JavaScript.
- Collect reports, screenshots, and traces so the final submission includes visible proof of execution.

Scope of Testing

The scope stays within the public AJIO customer experience. It is intentionally limited to normal shopping behavior and avoids anything that depends on internal admin tools, real payment handling, or genuine customer records

In Scope	Out of Scope
Sign up, login, logout, and account navigation Category browsing, product detail pages, search, and filtering Cart, wishlist, save-for-later behavior, and coupon checks Address, shipping, order review, and order confirmation screens Contact or help pages, order history, and basic account utilities.	Real payment processing or live card testing Admin panel actions or database changes Performance, load, security, and penetration testing Editing catalog prices, images, or backend configuration Using real personal data or production order information

Services/ Modules as Test cases

No.	Service/ Module	Planned Coverage	Count	Priority
1.	Registration and Login	Account creation, login/logout, invalid credentials, required-field checks, and session behavior	15	Critical
2.	Home page and product discovery	Landing page content, banner navigation, category tiles, product cards, and feature links	15	High
3.	Search, filters, and sorting	Keyword search, empty search, brand filter, size filter, price range, and sort order	15	High
4.	Product detail and selection	Image gallery, size/color selection, stock text, size chart, ratings, and add-to-bag actions	15	High
5.	Wishlist and save items	Add/remove wishlist items, save for later, move back to bag, and item count updates	15	Medium

6.	Cart and coupon handling	Add, update, remove, subtotal recalculation, coupon fields, and continue shopping flow	15	Critical
7.	Checkout and payment flow	Guest checkout, address validation, shipping options, payment choice, and order confirmation	15	Critical
8.	Account, orders, and support	Order history, profile pages, password change, contact/support pages, and help links	15	Low

Detailed Module Coverage

Registration and Login

- Check mandatory-field warnings when form inputs are left blank.
- Confirm that a new user can complete registration with unique dummy data.
- Verify that valid credentials open the expected account area.
- Confirm that invalid passwords or unknown emails show a clear error message.
- Validate logout behavior and session cleanup after signing out.

Product discovery and catalog

- Verify that the landing page surfaces categories and promotional content in a stable layout.
- Confirm that product tiles display names, prices, and image thumbnails correctly.
- Check brand and category navigation from listing pages.
- Validate that product cards open the intended detail page.
- Confirm that featured items and collection links guide the user to the correct section.

Search, filters, and sorting

- Verify keyword search against fashion-related product names and brands.
- Check that an empty query is handled gracefully.
- Confirm that filters for size, color, brand, and price affect the result list.
- Validate sorting behavior for relevance, price, and freshness of items.
- Check page navigation when the result set spans multiple pages.

Product detail and selection

- Verify the product image gallery and zoom or preview controls.
- Confirm that available sizes and colors can be selected before adding to the bag.
- Check that unavailable sizes are shown as disabled or unavailable.
- Validate the display of size charts, offer text, and delivery-related messaging.
- Confirm that add-to-bag behavior is blocked when a mandatory option is missing.

Wishlist and save items

- Verify that a user can save an item for later viewing.
- Confirm that wishlist counts increase and decrease correctly.
- Check that removing an item from the wishlist updates the list immediately.
- Validate move-to-cart or move-back-to-bag actions where available.
- Verify persistence of saved items during the session.

Cart and coupon handling

- Verify add-to-cart from listing and product detail pages.
- Check quantity updates, item removal, and subtotal refresh.
- Confirm that coupon or promo inputs respond correctly to valid and invalid values.
- Validate the continue-shopping path back to catalog pages.
- Check that cart content is preserved during normal navigation within the session.

Checkout and payment flow

- Verify guest checkout flow and registered-user checkout flow.
- Confirm validation for mandatory address fields.
- Check country, state, and postal-code handling where applicable.
- Validate payment option selection and order review content.
- Confirm that the order success screen displays expected confirmation text.

Account, orders, and support

- Verify order history and order detail access from the account area.
- Confirm password change validation and success messaging.
- Check profile, address, and notification pages for consistent navigation.
- Validate contact or help form submission and error handling.
- Confirm that sign-in and account links stay visible only when appropriate.

Types of testing planned

Testing Type	Purpose in the capstone
Validation	Check required fields, incorrect formats, and empty submissions.
Negative	Confirm that incorrect or incomplete actions are handled safely.
Functional	Confirm that shopping actions behave as expected from the customer point of view.
Navigation	Check menus, links, page transitions, and account movement.
Regression	Re-run important flows after script or data changes.
UI assertion	Verify visible headings, labels, counts, totals, and confirmation text.

Automation approach

The automation layer will be built with Playwright Test and kept modular so each service can run on its own. The intent is to keep the suite readable, maintainable, and easy to expand later without reworking the whole project.

- Use Playwright Test as the runner and keep each service in a separate spec file.
- Prefer stable locators such as role, label, placeholder, and visible text.
- Keep reusable setup logic small and focused, especially for login and product setup.
- Store dummy data separately from the test logic so names, emails, and addresses can be changed quickly.
- Use assertions for URLs, visible messages, product names, totals, and order confirmation text.

Test strategy

- All inputs will be dummy data, including names, phone numbers, emails, and addresses.
- Unique email addresses should be generated for registration checks to avoid duplicate-account conflicts.
- Products selected for tests should come from visible AJIO categories such as clothing, footwear, and accessories.
- Any required coupon, address, or shipping data should be reusable and easy to refresh.
- If the site changes its visible data, the assertions should be updated without changing the overall intent of the tests.

Reporting and evidence

- The Playwright HTML report will act as the primary execution record.
- Screenshots should be saved for important failures or for final proof where needed.
- Trace files can help explain unexpected behavior and make debugging easier.
- The final summary should show planned tests, automated tests, pass count, fail count, and pending items

Planned capstone flow

1. Finalize the website choice and testing scope.
2. Prepare 120 test cases across eight services.
3. Review and refine cases based on feedback.
4. Set up the Playwright project structure.
5. Automate the service-wise flows.
6. Run the suite, inspect failures, and fix issues.
7. Package the report, evidence, and submission folder.

Final Deliverables

Deliverables	Description
Capstone testing plan	This revised document covers scope, services, approach, and expected output.
Test case document	A service-wise set of 120 test cases with steps, expected results, priority, and status.
Playwright automation project	JavaScript test scripts organized by module
Test data files	Dummy data for registration, login, address, checkout, and forms.
Execution report	The HTML report produced after the test run.
Evidence folder	Screenshots, traces, or notes for important passed/failed scenarios.
Final summary	A concise wrap-up with coverage, results, known issues, and conclusion.

Conclusion

This AJIO e-commerce testing plan provides a clear and practical approach to validating key e-commerce functionalities such as browsing, cart, and checkout. With structured test coverage and Playwright automation, the project demonstrates effective QA practices, ensuring reliability, usability, and a strong understanding of real-world testing workflows.
